July 2026 · Application: Design Engineer, Web

Dear Anthropic team,

As models get more capable, the interface stops being decoration and becomes the safety layer - it's where a person understands what the AI is doing, how sure it is, and where they can step in. The web surface is where most people will ever meet a frontier model, so the craft of that surface is not a cosmetic concern; it's part of whether the thing is trustworthy at all.

I believe that enough that I built a small version of it before anyone asked. The Article 50 UI Pattern Kit is an open-source (MIT) React library I designed and shipped for the human-accountable layer of AI products - disclosure, content labelling, and a human-in-the-loop review gate - with a live demo where a model discloses itself, streams its reasoning, shows a real confidence meter, and routes low-confidence decisions to a person to approve, override, or reject (article50-kit.pages.dev). Every component is WCAG 2.1 AA with a passing axe audit. I'm a designer with 13 years of craft who ships in code (React, Tailwind, Astro), with Claude native to how I work - so I bring the rare overlap this role wants: visual taste, real front-end fluency, and a genuine feel for the interaction between a person and a model.

I'll be straight: I'm in Thessaloniki, and I know this role centres on your offices. I'm applying because the work is the exact thing I've oriented my craft around - making AI legible and controllable for the person on the other side of it - and Anthropic is the one company treating that as the whole point, not a compliance afterthought. If there's a way to make it work, I'd be glad to talk.

Best regards,

Sotiris Iliadis
